

4699 Pentode

This pentode is an indirectly-heated 18 W output valve of extremely high mutual conductance, for A.C. heater-supply. It was designed especially for small amplifiers with Class AB output stages. In view of the high mutual conductance the valve is extremely useful for supersensitive amplifiers. For two 4699 used in class AB output stage with automatic grid bias an alternating input voltage of 17 V_{eff} is sufficient to obtain a power output of 29 W. Older types of amplifying valves such as the 4689 are supplied with an anode voltage of 375 V, with 275 V screen; owing to the necessity for feeding the screen from a potential divider for this type of valve, there is a considerable drop in output at maximum modulation as the current passing through the potential divider is not high enough. When the grid signal increases, the screen current also rises, so that when a high resistance potential divider is used the screen voltage and grid swing are reduced. In practice the decrease in output due to this potential divider is 10 to 20 %.

The maximum anode and screen voltages of the 4699 are such that the latter may be fed direct, without the use of any potential divider, and the advantages of equal anode and screen potentials may be listed as follows:

- a) Less costly circuit, since two fairly high-wattage resistors and a smoothing capacitor are then unnecessary.

Fig. 3
Anode and screen current of the 4699 as functions of the grid bias for various values of anode and screen potential.

Fig. 1
Dimensions in mm.

Fig. 2
Arrangement of electrodes and base connections.

- b) Lower current consumption, in view of the absence of the potential divider.
- c) No reduction in output at maximum modulation, such as exists when the screen is fed from a potential divider.

The 4699 gives good results on both high and low voltages ($V_b = 450$ V and $V_b = 375$ V respectively); in the latter instance it is possible to economise in the supply section of the amplifier, whilst in the other case the stages of pre-amplification may be made more sensitive.

For a valve with such high mutual conductance the 4699 has an unusually low heater consumption (about 6.3 W), this being due mainly to the special form of the cathode.

HEATER RATINGS

- Heating: indirect by A.C.; parallel supply.
- Heater voltage. $V_f = 6.3$ V
- Heater current. $I_f = 1.0$ A

Fig. 4 Anode current as a function of the anode voltage for various values of grid bias with $V_{g2} = 250$ V.

CAPACITANCES

Anode-grid $C_{ag1} < 0.7 \mu\mu\text{F}$

OPERATING DATA

The 4699 used as single output valve in class A

Anode voltage	$V_a =$	250 V
Screen-grid voltage	$V_{g2} =$	250 V
Cathode resistor	$R_k =$	90 ohms
Anode current	$I_a =$	72 mA
Screen-grid current	$I_{g2} =$	8 mA
Mutual conductance	$S =$	14.5 mA/V
Amplification factor; screen with respect to control grid	$\mu_{g2g1} =$	20 —
Internal resistance	$R_i =$	20,000 ohms
Load resistor	$R_a =$	3,500 ohms
Alternating input voltage ($I_{g1} = + 0.3 \mu\text{A}$)	$V_i =$	5.3 V _{eff}
Power output ($I_{g1} = + 0.3 \mu\text{A}$)	$W_o =$	8 W
Total distortion ($I_{g1} = + 0.3 \mu\text{A}$)	$d_{tot} =$	10 %
Alternating input voltage ($W_o = 50 \text{ mW}$)	$V_i =$	0,3 V _{eff}

The 4699 used in class AB output stage with auto. grid bias (two valves)

Supply voltage	$V_b =$	425	375	V	
Load resistor between anodes	$R_{aa} =$	8,000	6,000	ohms	
Common screen-grid series resistor	$R_{g2} =$	2,200	700	ohms	
Cathode resistor	$R_k =$	170	125	ohms	
Alternating input voltage	$V_i =$	0	17	0	14 V _{eff}
Anode voltage	$V_a + V_{Rk} =$	405	400	355	350 V
Anode current	$I_a =$	2×46	2×58	2×52	2×64 mA
Screen-grid current	$I_{g2} =$	2×5	2×14.5	2×6.5	2×16.5 mA
Power output	$W_o =$	0	29	0	27.5 W
Total distortion	$d_{tot} =$	—	5	—	4 %

The 4699 used in triode connection as single output valve class A (screen-grid connected to anode)

Supply voltage	$V_b =$	375 V	Alternating input		
Cathode resistor	$R_k =$	300 ohms	voltage	$V_i =$	11 V _{eff}
Load resistor	$R_a =$	4,000 ohms	Power output	$W_o =$	4.5 W
Anode current	$I_a =$	50 mA	Total distortion	$d_{tot} =$	9 %

The 4699 used in triode connection in class AB output stage with auto. grid bias (two valves)

Supply voltage	$V_b =$	400	V
Load resistor between anodes	$R_{aa} =$	5,500	ohms
Common cathode resistor	$R_k =$	175	ohms
Alternating input voltage	$V_i =$	0	13.5 V _{eff}
Anode current	$I_a =$	2×48	2×54 mA
Power output	$W_o =$	0	13 W
Total distortion	$d_{tot} =$	—	1.5 %

MAXIMUM RATINGS

Anode voltage in cold condition	$V_{ao} = \text{max.}$	800 V
Anode voltage	$V_a = \text{max.}$	425 V
Anode dissipation	$W_a = \text{max.}$	18 W
Screen-grid voltage in cold condition	$V_{g2o} = \text{max.}$	650 V
Screen-grid voltage	$V_{g2} = \text{max.}$	425 V
Screen dissipation without signal	$W_{g2} = \text{max.}$	2 W
Screen dissipation at max. modulation	$W_{g2} = \text{max.}$	5 W
Cathode current	$I_k = \text{max.}$	90 mA
Grid voltage at grid current start ($I_{g1} = +0.3 \mu\text{A}$)	$V_{g1} = \text{max.}$	-1.3 V
External resistance between grid and cathode (auto. bias)	$R_{g1} = \text{max.}$	0.7 M ohm
External resistance between grid and cathode (fixed bias)	$R_{g1} = \text{max.}$	0.5 M ohm
External resistance between heater and cathode	$R_{fk} = \text{max.}$	20,000 ohms
Voltage between heater and cathode	$V_{fk} = \text{max.}$	50 V

The 4699 is operated with automatic grid bias; semi-automatic bias may be employed, provided that the cathode current in the output stage constitutes more than 50 % of the total current flowing in the resistor producing the bias. The value of R_{g1} must then be reduced in accordance with the following:

$$\frac{\text{Cathode current of output valve}}{\text{Total current passing through resistor producing the voltage drop}} \times R_{g1}$$

Due to the high mutual conductance, a stopper resistor of about 1,000 ohms is included in the grid lead to prevent oscillation.
