NOTES:

1. Limitations beyond which normal tube performance and tube life may be impaired.
2. If altitude rating is exceeded, reduction of instantaneous voltage (Ef excluded) may be required.
3. Tube life and reliability of performance are directly related to the degree of regulation of the heater voltage to its center rated value of 6.3 volts.
4. External shield of 0.405 inch diameter connected to cathode.
5. Values shown are as registered with RETMA.
6. Per MIL-E-1C par. 6.5 and General Section of this Sylvania Subminiature Tube Manual titled Specifications and Ratings.

QUICK REFERENCE DATA

The Premium Subminiature Type 6205 is a sharp cutoff pentode having an external Grid No. 3 connection. It is otherwise identical to the 5840. The 6205 is well suited to amplifier service at frequencies up to 900 mc and is designed to provide dependable operation under conditions of severe shock, vibration, high temperature and high altitude.

It is manufactured and inspected to meet the applicable MIL-E-1 specification for reliable operation.

ACCEPTANCE CRITERIA NOTES:

- The AQL for the combined defectives for attributes in Measurements Acceptance Tests, Part 1, excluding inoperatives and mechanical shall be one (1) percent. A tube having one (1) or more defects shall be counted as one (1) defective.
- Tubes subjected to the following destructive tests are not to be accepted under this specification.
 - 4.9.5.3 Subminiature lead fatigue
 - 4.9.20.5 Shock
 - 4.9.20.6 Fatigue
 - 4.11.7 Heater cycling life test
 - 4.11.5 Intermittent life test
- Envelope temperature is defined as the highest temperature indicated when using a thermocouple of # 40 BS or smaller diameter elements welded to a ring of 0.025 inch diameter phosphor bronze placed in contact with the envelope. Envelope temperature requirement will be satisfied if a tube, having bogey I_b (±5%) under normal test conditions, is determined to operate at maximum specified temperature at any position on the life test rack.
- Types 5840 and 6205 are the same except for suppressor grid and cathode connection. Type 6205 has not been designed for control or gating purposes using the number 3 grid.
- Prior to this test, tubes shall be preheated five (5) minutes at conditions indicated below. Test within three (3) seconds after preheating. Three-minute test is not permitted. Grid Emission shall be the last test performed on the sample selected for the Grid Emission Test.

Ef	Ec1	Ec2	Ec3	Eb	Rk	Rg1
V	Vdc	Vdc	Vdc	Vdc	Ohms	Mcg
7.5	0	100	0	100	150	1.0

6: The tube shall be rigidly mounted on a table vibrating such that the instantaneous values of acceleration shall constitute approximately a "White Noise" spectrum which is free from discontinuities from 100 cps to 5000 cps. The spectrum of instantaneous acceleration shall be such that each octave of bandwidth delivers 2.3 G's rms acceleration. With this the case, the rms value of acceleration for any bandwidth within the specified spectrum is equal to

$$G_{rms} = 2.3 G \sqrt{3.32 \log_{10} (f_2/f_1)}$$

f₂ and f₁ are the upper and lower frequencies respectively of the band under consideration. The degree of clipping of the peak accelerations shall be such that the peak value of acceleration is at least 15 G's.

The voltage (ep) produced across the resistor (Rp) as a result of vibration shall be coupled through a compensating amplifier to a low pass filter. The compensating amplifier shall have a high input impedance (0.25 megohm or more) and shall be adjusted to compensate for any insertion losses in the filter. The combined frequency response of amplifier and filter shall be flat within ±0.5 db from 50 cps to 8000 cps, shall be down no more than 5 db at 10,000 cps and at 20 cps, and down at least 40 db at 13,000 cps. For reading the peak to peak value of output voltage the filter output shall be fed directly to the input of a Ballantine Model 305 peak to peak electronic voltmeter or equal, while the rms value shall be measured with a Hewlett-Packard Model 400C or equal.

APPLICATION DATA

The 6205 is a Premium Subminiature, sharp cutoff pentode having an external suppressor grid connection. Electrically, the 6205 is otherwise identical to the 5840. This type is characterized by long life and stable performance under conditions of severe shock, vibration, high altitude and high temperature.

The 6205 is intended for use as an rf amplifier at frequencies up to 400 mc, as well as many low frequency

applications. As the frequency of operation is increased, consideration should be given to the resultant decrease in input and output resistance, Figure 1. Assuming matched input and output impedance, approximate tube gain can be obtained from the formula:

$$\text{Voltage Gain} = \frac{gm \sqrt{R_{input} \times R_{output}}}{2}$$

APPLICATION DATA (Continued)

Figure 1—Input and output resistance vs frequency.

where the values of R_{input} and R_{output} are obtained from the curves of Figure 1. The use of this formula assumes matched impedances into and out of the amplifier stage under consideration. If the source impedance is lower than the input resistance or if the load resistance is higher than the output resistance, much greater voltage gain per stage can be obtained than that indicated by the above formula. The voltage gain of a matching circuit is equal to the square root of the impedance ratio.

In some applications it may be advantageous to place an unbypassed resistance in the cathode circuit to compensate for the change in input capacitance with bias. This unbypassed resistance reduces the effective gm of the tube by the factor

$$\frac{1}{1 + gm R_k \left(\frac{I_b + I_{c2}}{I_b} \right)}$$

However, it also has the effect of raising the input re-

sistance of the tube under certain operating conditions so that both a net increase in gain and a net decrease in input capacitance change may result. The 6205 is particularly well suited to such applications since the suppressor grid may be grounded directly, thus providing greater stability. It should be noted that the suppressor grid is not intended as a control electrode.

The self neutralization frequency of the 6205 is approximately 200 mc. At this point the inductance of the tube leads resonate with the grid plate capacitance to effect neutralization. At higher frequencies the feedback is inductive and takes place through the tube leads. Two cathode leads are provided to minimize this effect and permit isolation of the input and output circuits. The external suppressor grid connection also facilitates the possible employment of suppressor grid neutralization techniques*.

Resistance coupled amplifier data is presented in the accompanying table.

To insure correlation with actual field conditions and thereby enhance equipment reliability, vibrational noise output is controlled by the "white noise test" as shown in the acceptance criteria. Briefly, this test consists of subjecting the tube to a white noise vibration spectrum covering the frequency band of 100 to 5000 cps at a rms level of 2.3 g's per octave and a peak level of 15 g's. Limits are shown for both peak and rms output. A further discussion of the white noise vibrational test is included in the frontal section of this manual.

The 6205 is manufactured and inspected to meet the applicable Mil-E-1 specification for reliability.

Life expectancy is described by the life tests, specified on the attached pages and/or individual MIL-E-1 specifications. The actual life expectancy of the tubes in an operating circuit is affected by both the operating and environmental conditions involved. Likewise, the life tests specified indicate performance under certain operating criteria to a set of specified end points. Performance at conditions other than those specified can usually be estimated only roughly as giving better or poorer life expectancy. For further discussion of life expectancy, reference should be made to the frontal section of this manual.

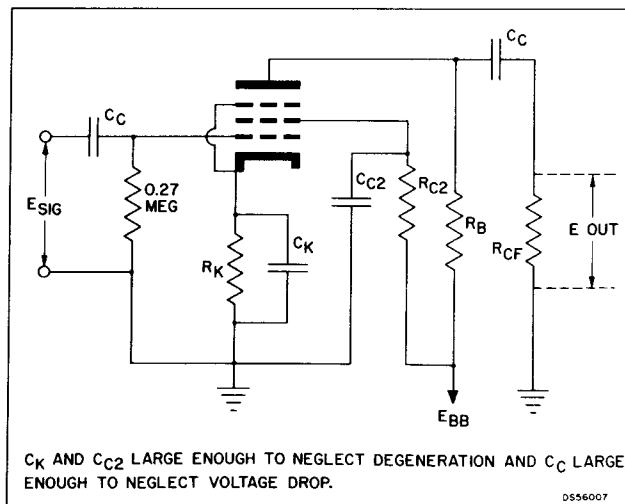

When operated under conditions common to on-off control applications the tube exhibits freedom from the development of interface resistance. The heater-cathode construction is designed to withstand intermittent operation.
