## TRIODES TH 6885 . TH 6886

The TH 6885-TH 6886 tubes are triodes of planar electrode construction, forced air cooled, for use as an oscillator, amplifier or frequency multiplier at very high and ultra high frequencies up to 3000 megacycles.

The electrodes terminals were designed to provide easy mounting in resonating cavities - circular cavities, coaxial lines, etc... and very low lead inductance.

The anode can dissipate 250 W.

Two types can be supplied : TH 6885 for CW operation and TH 6886 for pulse operation.

### GENERAL CHARACTERISTICS (2)

#### ELECTRICAL

|                                       |                |            |     |
|---------------------------------------|----------------|------------|-----|
| Type of cathode                       | oxide - coated |            |     |
| Heating                               | indirect       |            |     |
| Heater voltage                        | 6.3            | V          | (1) |
| Heater current (approx.)              | 2.1            | A          |     |
| Cathode heating time minimum          | 120            | s          |     |
| Direct interelectrodes capacitances : |                |            |     |
| Grid-cathode { cold                   | 12             | $\mu\mu F$ |     |
| hot                                   | 14             | $\mu\mu F$ |     |
| Grid-anode { total capacity           | 3.6            | $\mu\mu F$ |     |
| Cathode-anode                         | 0.06           | $\mu\mu F$ |     |
| Amplification factor                  | 80             |            |     |
| Transconductance (Ip = 350 mA)        | 29,500         | $\mu mho$  |     |

#### MECHANICAL

|   |                    |
|---|--------------------|
| Mounting position                               | any                |
| Anode cooling                                   | forced air         |
| Maximum temperature of radiator top             | see curve page 4   |
| Maximum temperature of the electrodes terminals | 140 °C             |
| Approximate net weight                          | 172 g              |
| Outside dimensions                              | see drawing page 8 |

(1) In order to secure a maximum life, it may be eventually necessary to decrease the heater voltage if the tube is used in continuous duty at frequencies above 1000 megacycles. Our Company is to be consulted on the subject.

(2) These characteristics are given as indications only. Refer to specifications for typical characteristics.

## MAXIMUM RATINGS

|                    | 6885                  |                    | 6886                                       |            |
|--------------------|-----------------------|--------------------|--|------------|
|                    | continuous duty       |                    | pulse duty<br>(pulse length 2 $\mu$ s max) |            |
|                    | without<br>modulation | with<br>modulation | Vf = 6.3 V                                 | Vf = 7.0 V |
| Anode voltage      | 1200 V                | 1500 V peak        | 6000 V                                     | 6000 V     |

| DC cathode current | 250 mA                | 200 mA             | 9 A  | 15 A       |
| DC grid current    | 50 mA                 | 50 mA              |  |            |
| Duty cycle         |                       |                    | 0.0005                                     | 0.0005     |

Anode dissipation 250 W  
 Grid dissipation 2 W

## TYPICAL OPERATION

## a) Radio frequency oscillator (6885)

| Frequencies :  | 1000 MC | 1500 MC | 3000 MC |
|--|---------|---------|---------|
| DC anode voltage                                     | 1200 V  | 1200 V  | 1200 V  |
| DC grid voltage<br>(Cathode bias resistor operation) | -60 V   | -45 V   | -30 V   |
| DC anode current                                     | 200 mA  | 200 mA  | 200 mA  |
| DC grid current                                      | 20 mA   | 10 mA   | 3 mA    |
| Power output approx.                                 | 64 W    | 52 W    | 16 W    |

## b) Plate pulsed power oscillator (6886)

| Frequency :  | 3000 MC   |
|--|-----------|
| Heater voltage                                       | 6.3 V     |
| Peak anode voltage                                   | 6000 V    |
| DC grid voltage<br>(Cathode bias resistor operation) | -100 V    |
| Peak anode current                                   | 6 A       |
| Peak grid current                                    | 2.5 A     |
| Peak power output useful                             | 7 kW      |
| Pulse length   | 1 $\mu$ s |
| Repetition frequency                                 | 500 pps   |

With somewhat reduced life time the tube can be operated in the following conditions :

| Frequency :                      | 3000 MC   |
|----------------------------------|-----------|
| Heater voltage                   | 7 V       |
| Peak anode voltage               | 6000 V    |
| DC grid voltage                  | 0 V       |
| Peak anode current               | 12 A      |
| Peak power output useful approx. | 12 kW     |
| Pulse length                     | 1 $\mu$ s |
| Repetition frequency             | 500 pps   |

## COOLING &amp; MOUNTING

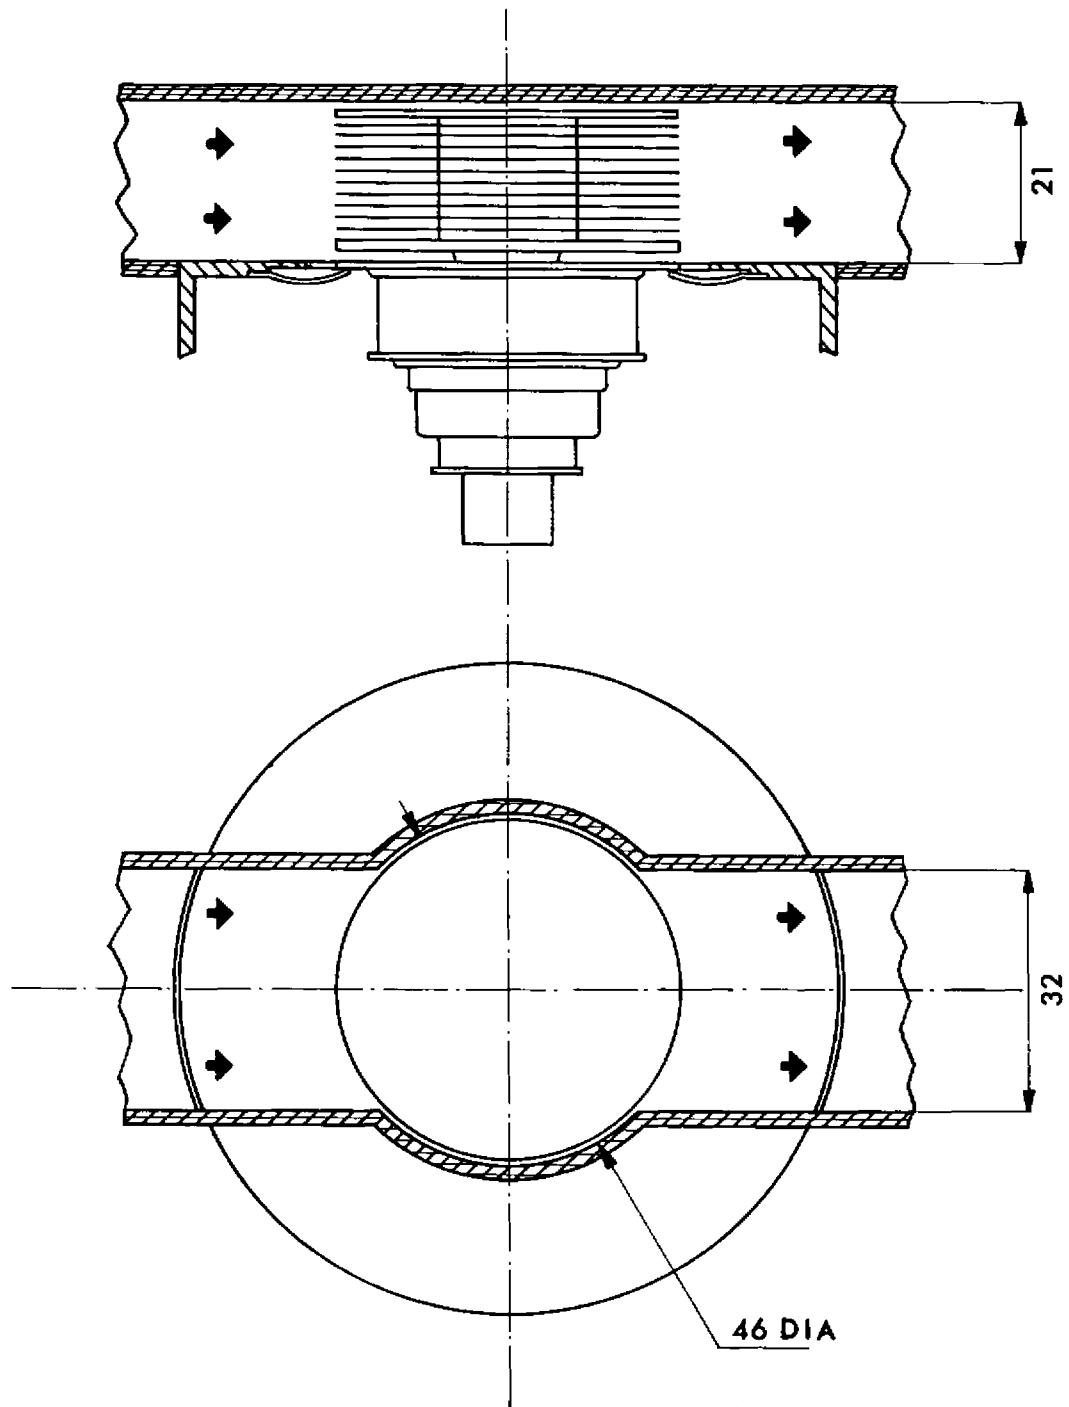

The contact zones of the grid, the cathode and the filament must be cooled so that the temperature will not exceed 140 °C. The cooling of these zones must last two minutes after the interruption of the heating.

The anode radiator must be cooled by means of an air flow guided by a duct, the section of which will conform partially with the outside of the radiator which will insure the air flow in the whole section of the radiator.

For example we indicate (page 3) the schematic arrangement of such a duct used for cavity transmitters. The curves (page 5) indicate in this case the flow of air necessary as a function of the anode dissipation for air intake temperatures from 20 °C to 50 °C and air pressure at the intake.

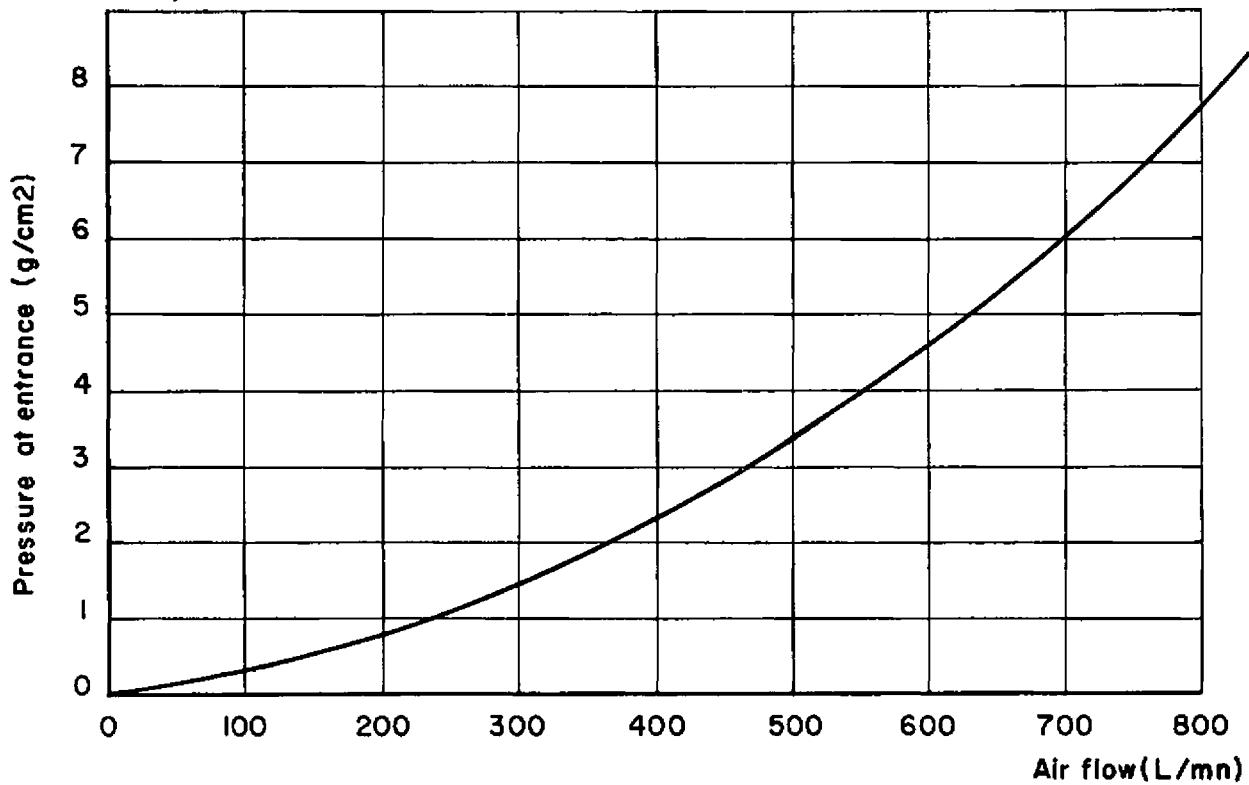

The contacts between the tube and the circuits, in particular those of the cathode, the anode and the grid, must be designed with the greatest care so that they will insure the flow of the current on the whole circumference of the electrodes, without however applying to the tube any shearing stresses. The anode contact will take place preferably on the flat lower portion of the anode disk, by means of a ring of springs an example of which is given, page 7. The grid contact can be obtained, depending on the nature of the circuit - plane cavity, coaxial line - either on the plane portion, or on the cylindrical portion of the central element of the tube.

AIR DUCT

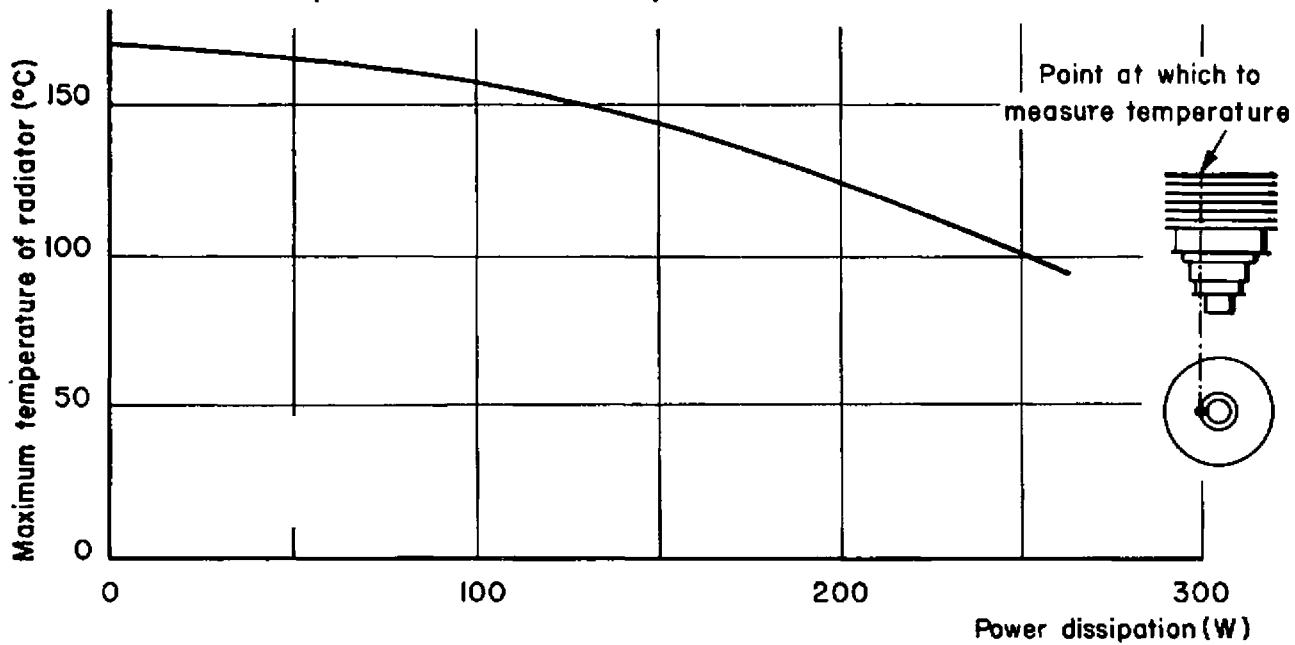

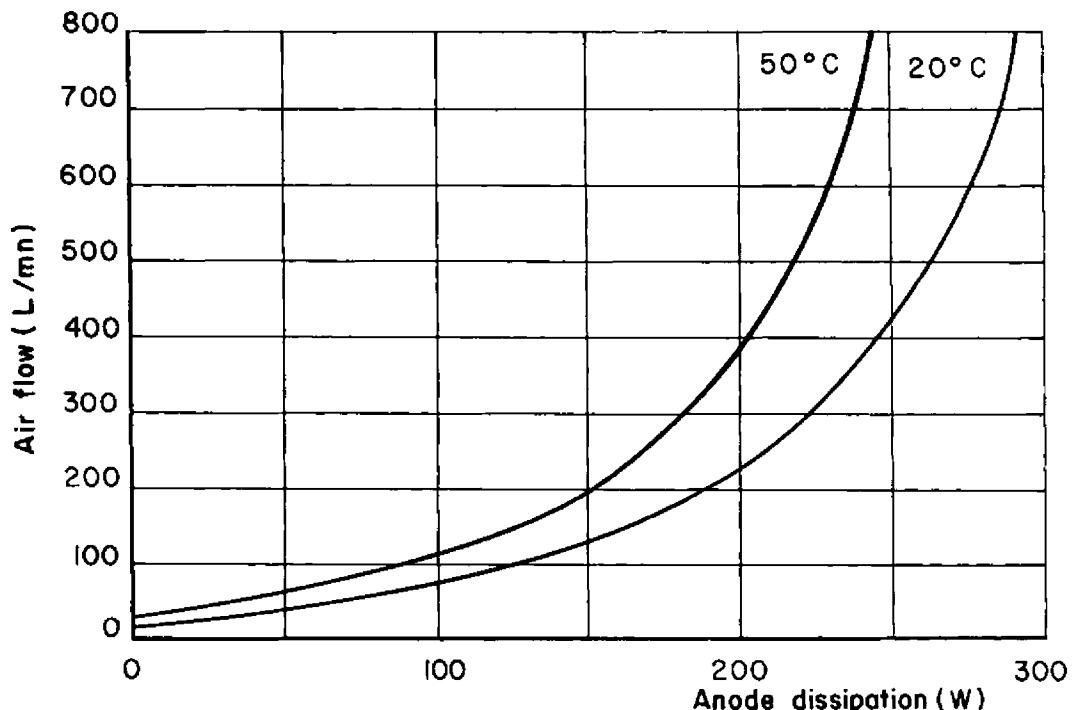

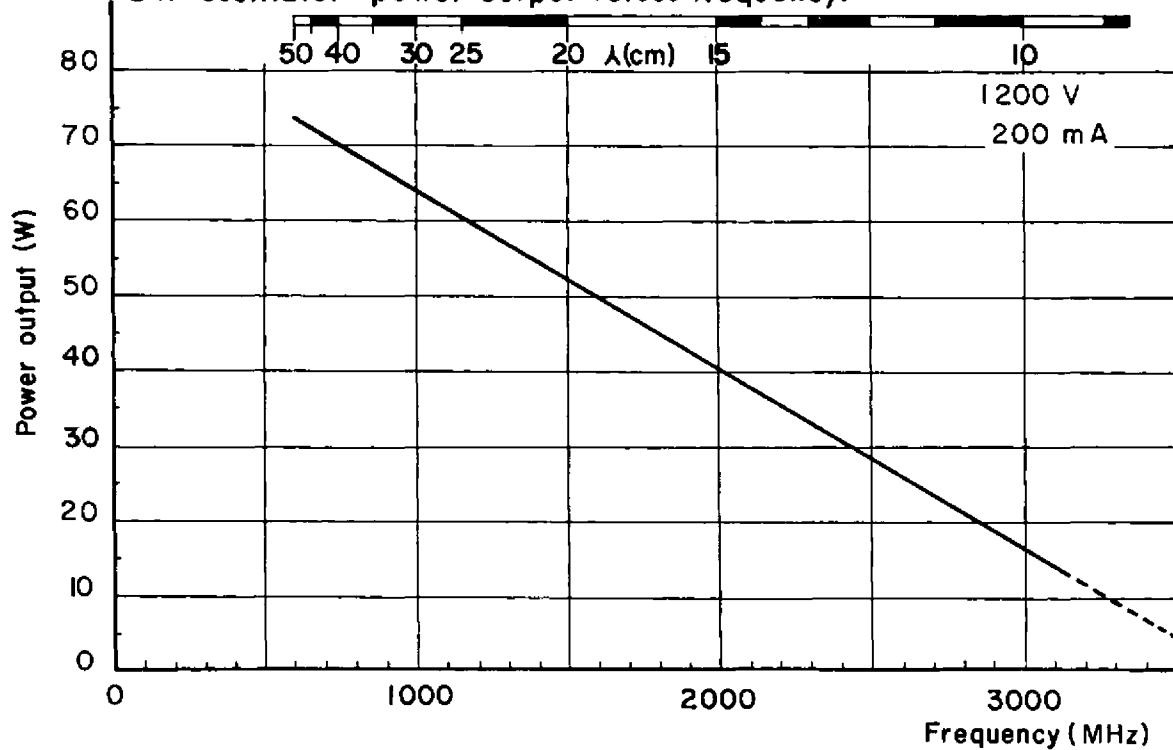

All dimensions in millimeters

## Air pressure at the entrance of the duct

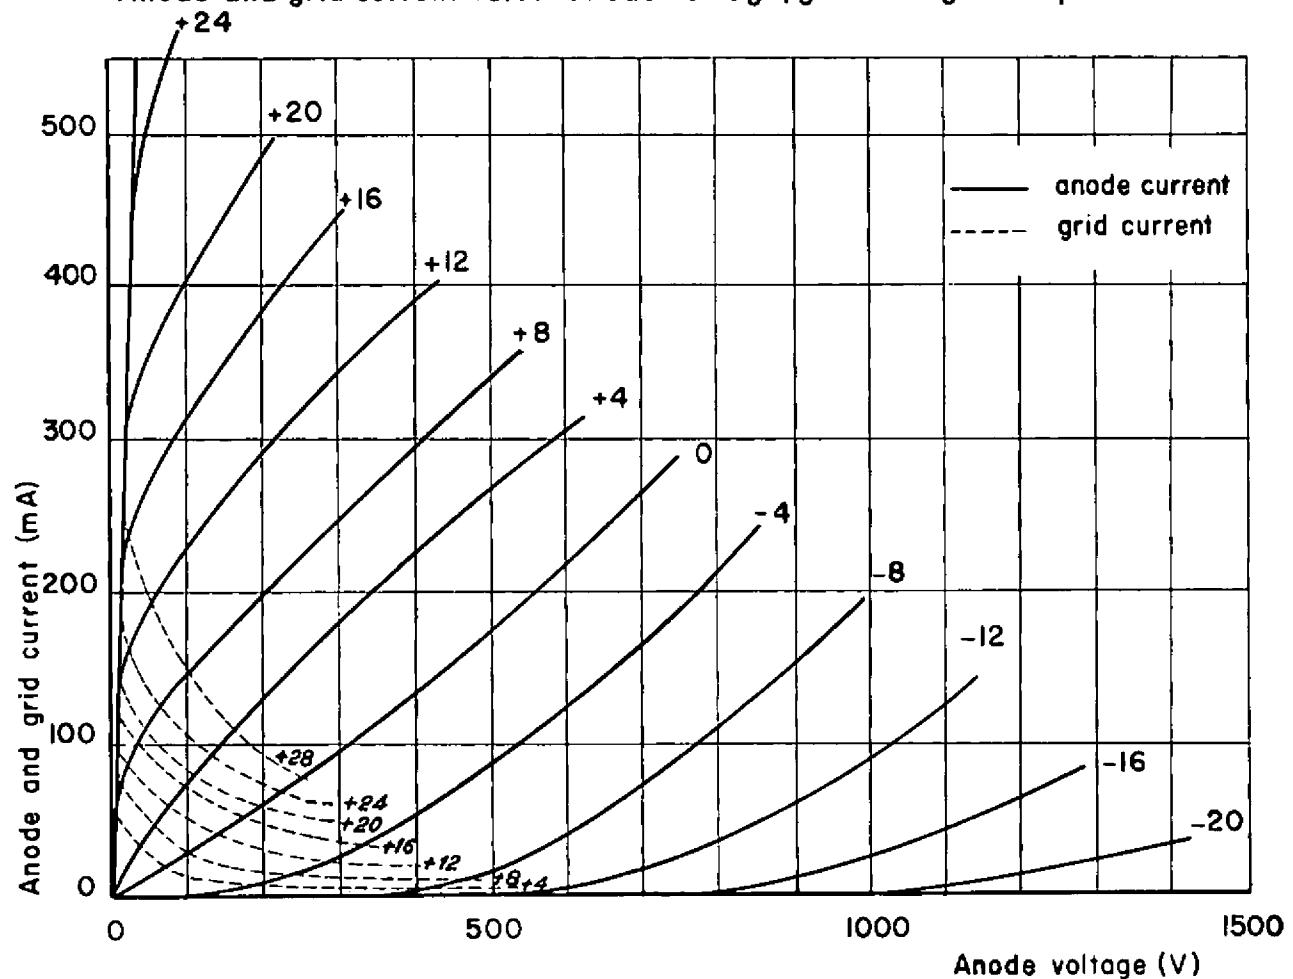

## Maximum temperature at radiator top

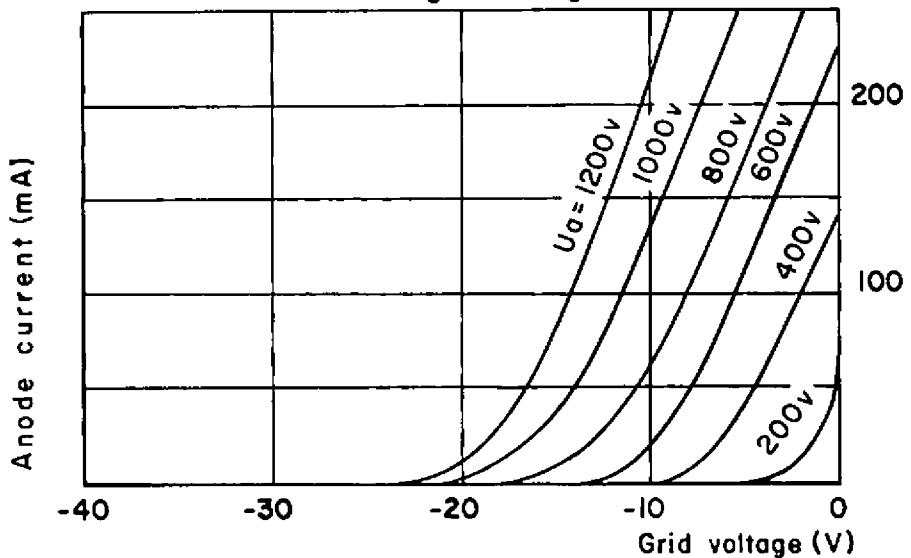

**Air flow versus anode dissipation for entrance temperatures from 20 to 50°C****CW oscillator - power output versus frequency.**
