

Sylvania  
**TYPE 6L6**  
**POWER**  
**AMPLIFIER**

**CHARACTERISTICS**

|                                   |                                 |
|-----------------------------------|---------------------------------|
| Heater Voltage AC or DC . . . . . | 6.3 Volts                       |
| Heater Current . . . . .          | 0.9 Ampere                      |
| Maximum Over-all Length . . . . . | 4 <sup>5</sup> / <sub>8</sub> " |
| Maximum Diameter . . . . .        | 1 <sup>3</sup> / <sub>8</sub> " |
| Base—Octal 7-Pin . . . . .        | 7-AC                            |

**Static and Dynamic Characteristics:**

|                                |            |
|--------------------------------|------------|
| Heater Voltage . . . . .       | 6.3 Volts  |
| Plate Voltage . . . . .        | 250 Volts  |
| Screen Voltage . . . . .       | 250 Volts  |
| Grid Voltage . . . . .         | -14 Volts  |
| Plate Current . . . . .        | 72 Ma.     |
| Screen Current . . . . .       | 5 Ma.      |
| Plate Resistance . . . . .     | 22500 Ohms |
| Mutual Conductance . . . . .   | 6000 μmhos |
| Amplification Factor . . . . . | 135        |

**Operating Conditions and Characteristics:**

CIRCUIT APPLICATION

Sylvania Type 6L6 is an all-metal power amplifier tube designed for use in the output stage of radio receivers, particularly in those designed to have a reserve of power capability. The tube provides high power output, power sensitivity and efficiency, with low percentage of third and higher order harmonics.

New design principles, responsible for the above features, involve the use of directed electron beams. These effects are produced by arranging the tube elements in such a manner that potential fields are set up which confine the electrons into beams of high density. Efficient suppressor action is produced by the space-charge effects formed between the screen and plate. Very little power is taken by the screen.

The second harmonic distortion is intentionally high in order to reduce the third and higher order harmonics to a minimum. Elimination of the second harmonic distortion can be obtained by using Type 6L6 tubes in a push-pull arrangement. If only one tube is used in a resistance coupled circuit, second harmonics can be reduced by generating out-of-phase second harmonics in preceding audio stages.

It is recommended that circuits be used which avoid the effects of loud speaker resonance and variable impedance.

Additional information pertaining to the reference marks which appear in the various tabulations of ratings and operation characteristics for Type 6L6 is given below:

The number "1" used in conjunction with the terms Class A and Class AB indicates that no grid current flows during any part of the input cycle. Likewise, the number "2" indicates that grid current does flow during some part of the input cycle.

<sup>o</sup> The heater voltage rating for Type 6L6 is 6.3 volts. Precautions should be taken to prevent the heater voltage from exceeding a maximum value of 7.0 volts during line voltage fluctuations. A minimum potential difference between heater and cathode should be maintained.

\* The maximum plate and screen dissipation must not be exceeded. Provision should be made for line voltage changes, especially when fixed-bias operation is employed.

† Indicates zero signal.

‡ Transformer or impedance coupling devices are recommended and the resistance introduced in the grid circuit should be kept as low as possible. For fixed bias this resistance should not exceed 0.1 megohm. The maximum grid circuit resistance when self-bias is employed may be 0.25 megohm if the heater voltage does not exceed 7.0 volts. See first note above.

+ The plate circuit distortion does not exceed 2% with a zero impedance driver.

¶ For Class AB operation the driver stage should be designed so as to be capable of supplying the required peak power with low distortion to the grids of the output stage.
